

Setup to mode stn:

Relay 16 board is at COM 6 (plugs to top black)

Relay 5 board is at COM 4 (plugs to bot black)

Ag is at COM 3 at 250K plugs to top blue

CRD = back = better blue

Mouse = front

Installed CPUID HWMonitor to watch temps remotely.

After turning off Intel Turbo Boost Temp is holding at 48C.

In Windows Control Panel Power Mode "changed to
"best performance" from "balanced"

Did Start Settings System Power Balanced.

Reverted to "best performance" to try to get below 47C.

This gets it down to 45C. 😊
